

Register User Account with PHP and MySQL

Melissa Holmes, Department of Computer Science at Montana Tech

Overview and Requirements

- These slides provide directions for the user account registration required for the ecommerce project in CSCI 210. The user will enter information into the HTML form, and it will be written to two tables in the database: customers and auth.
- Requirements:
 - A web server running PHP, and a MySQL server
 - A user registration form with a target page
 - A MySQL database with two tables:
 - auth - stores usernames and passwords
 - customers – stores customer name, email address, shipping address, etc.
 - These two tables must have one column in common

Additional Resources

- W3Schools:
 - [PHP form handling](#) - use the \$_POST superglobal to move data from one page to another
 - [PHP MySQL Database connection](#) - review the MySQLi example, and see it implemented in the example files
 - [MySQL INSERT INTO statement](#) – inserts data into a table
- GitHub:
 - A simple registration script is available on the instructor's GitHub site. It may be helpful to download it before you begin.

Database

- You should have an existing database with two tables: customers and auth. Screenshots of those tables, with data, are below.
- Notice the tables have a column in common: the usernames are also stored in the customers table.
 - You can use a different column, i.e. both tables can have the UserID, or email.

customers

CustID	CustName	email	phone	username
13	Melissa Holmes	mholmes@mttech.edu	406-444-5555	profmayhem
1	Tom Jones	tom@email.com	406-123-4567	tjones
23	George Gorgeous	gg@gorge.com	123-444-6567	gggeorge
2	James Stroebe	james@email.com	406-327-7777	thejames

auth

username	password
gggeorge	password
profmayhem	password
thejames	password
tjones	password

Note how the tables have a column in common with matching data

MySQL Queries

We will run an INSERT query against both tables, inserting the form data.

1. Username and password – insert into the auth table:

```
INSERT INTO `auth` (`username`, `password`) VALUES ('nikothegreat', 'mypass123');
```

2. Customer info – insert into the customers table:

```
INSERT INTO `customers` (`CustID`, `CustName`, `email`, `phone`, `username`)  
VALUES ('21', 'Niko', 'niko@email.com', '4065551727', 'nikothegreat');
```

Notes:

- Your PHP script must insert values into BOTH tables, i.e. you must run both queries
- Refer to the Simple User Authentication slides for more info about syntax and using the `$_POST` superglobal to transfer data from one page to another
- Download the scripts from GitHub and modify them to match your database
- Your HTML forms must match your database so the user can enter the correct data

The Registration form (HTML and PHP)

Name:

Email:

Phone:

Username:

Password:

```
<form action="phpregtarget.php" method="POST">  
  <label for="CustName">Name:</label><br>  
  <input type="text" name="custname"><br>  
  <label for="CustEmail">Email:</label><br>  
  <input type="text" name="custemail"><br>  
  <label for="CustPhone">Phone:</label><br>  
  <input type="text" name="custphone"><br>  
  <label for="Username">Username:</label><br>  
  <input type="text" name="username"><br>  
  <label for="Password">Password:</label><br>  
  <input type="text" name="password"><br>  
  <input type="submit" value="Submit">  
</form>
```

Download the examples

- Please download the examples as a .zip file from Canvas, or from GitHub. You should be able to make just a few changes to implement your user registration.
